BonBot : A Chatbot for Mental Health

BonBot is an mental health support chatbot powered by NLP that can maintain an empathetic and engaging conversation with its user while also listening to all that they have to say.

The application is mainly focused toward those who are feeling low and find it uncomfortable to talk about themselves as the bot may be able to better their mood while also decreasing the users stress and anxiety BonBot was developed using Natural Language Processing.

We've used Tensorflow to implement our algorithms. We used React for the front end of the chat application. Flask was used to create the APIs for the questions and responses.
